

14.35487ptThus, I came to the conclusion that the designer  
of a new system must not only be the implementer and  
first large-scale user; the designer should also write the  
first user manual.

The separation of any of these four components would have  
hurt TeX significantly. If I had not participated fully in  
all these activities, literally hundreds of improvements  
would never have been made, because I would never have  
thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly in-  
fluenced by a single person. Once the initial design is  
complete and fairly robust, the real test begins as peo-  
ple with many different viewpoints undertake their own  
experiments. Thus, I came to the conclusion that the de-  
signer of a new system must not only be the implementer  
and first large-scale user; the designer should also write  
the first user manual.

The separation of any of these four components would have hurt TeX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments. Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.
